ANNOUNCEMENTS

- ???

What is the alignment problem?

Given: A collection of sequencing reads, and some target sequence (e.g. a genome)

Find: For each read, all locations where the read is within edit distance ϵ of the reference, and the edits that achieve this distance.

Spliced Alignment

Splice junctions might be known, or *unknown*.

Overlap of read with exon may be *very short*, sequence is ambiguous (e.g. 10 bases).

Sequence of read might be repetitive in the genome.

Aligning reads to a Transcriptome

Consider the following scenario:

Transcripts

Read
